Review of: "Quantifying Water-Food Nexus (Water Footprint) for Food Crop Production: A Case Study of Addis Ababa City"

Peter Ozaveshe Oviroh¹

1. University of Johannesburg, South Africa

The work presented has great potential in addressing the issue of water and food. However, can the authors look at the title again and rephrase it?

The authors could have used the title without necessarily adding a water footprint. The text could provide an explanation of the water footprint component. "Quantifying Water-Food Nexus for Food Crop Production: A Case Study of Addis Ababa City".

The authors can also add links to the references. This procedure would allow readers easy access to the sources of information.

The presentation of the figures and equations is well done. I recommend accepting it with minor corrections.
