Half Maximal Inhibitory Concentration Fold Change from Baseline Measurement

National Cancer Institute

Source

National Cancer Institute. *Half Maximal Inhibitory Concentration Fold Change from Baseline Measurement*. NCI Thesaurus. Code C116250.

A fold change based on a concentration of a specific drug expected to produce 50% inhibition of the standard growth of a viral organism, or of a biological/biochemical reaction. It is a ratio calculated by the current IC50 Treatment Result divided by the IC50 Treatment Result from the baseline visit.
