**Potential competing interests:** No potential competing interests to declare.

This Mini-review explores the global impact of foodborne RNA viruses, focusing on norovirus and hepatitis A, and aims to address the prevalence, transmission routes, and risk factors associated with foodborne RNA viruses. Please pay attention to the fact that this statement in the introduction exhibits redundancy. Besides, the organization of some information requires refinement, and some sentences lack precision and formality. Finally, I suggest the inclusion of "Hepatitis A and Norovirus as Foodborne RNA Virus Infections" in the title. This adjustment enhances inclusivity and better communicates the paper's scope to the readers.

This summary provides a limited in-depth exploration of the topic, which is understandable given the concise nature of the mini-review. With minor changes, this review becomes very helpful for enhancing the understanding of specific foodborne viruses among non-specialists.
