Potential competing interests: No potential competing interests to declare.

The authors explain the very well-structured review on the machinability of titanium alloys during milling, with major aspects covered in the article. In view of my suggestion, the following points may help to improve the quality of the article:

1. Improve the abstract with concise wording.
2. The introduction section must add recent developments in this area of research.
3. A literature review of at least 800 words is mandatory.
4. The importance of coolants and their effect on performance attributes.
5. Improve the conclusion section with some key points.
