Dear authors,

I am glad I have the possibility review your manuscript and in this way try to collaborate with other reviewers/scientists via the Qeios platform. My comments/notes are as follows:

Abstract

- the main aim of the study should be specified (for further possible evaluation), see SMART requirements
- I prefer more information about the methodology and methods used for fulfillment of the aim stated
- extend the information about the results achieved (highlight the most important findings of your own research)

Literature review and Background

- too long, too extensive
- topic is described very widely with long paraphrases (in this way, what is an added value?)

Methodology

- this section is processed at insufficient level, many important information is missing

Results and Discussion

- data are interpreted via simple figures without any other processing, description is very simply without any additional information for readers
- a real discussion is totally missing

Conclusions and Policy Implications

- simple summarization of previous text
- no information about the limitations of the research presented, not information about its further processing (further research indication)

The idea of the manuscript could be fine and actual, but the whole processing should be rapidly improved.
