Reviewers' comments on the manuscript "Probabilistic Assessment on Heavy Metal Pollution in Debrecen's Topsoil"

The manuscript describes the probabilistic assessment of heavy metal pollution in Debrecen's topsoil. This is quite an important and interesting issue given the role of heavy metals in public health around the globe. However, I have a few observations.

1. The abstract captured atmospheric deposited dust particles rather than topsoil samples, which confuses the title "Probabilistic Assessment on Heavy Metal Pollution in Debrecen's Topsoil."
2. The analytical procedure was not clear; there seems to be a missing word in the second sentence in section 2.3 before "analyzer."
3. The minutes and seconds, as described by the authors, were described as few. This should have been specific and measurable in order to encourage reproducibility of the experiment.
4. "Recorded" should be a more scientific word than the phrase "noted down."
5. The keys on the map are not clear and could not be really interpreted by me.
