Potential competing interests: No potential competing interests to declare.

A general introduction should be included, outlining the background and objectives.

References should be added, particularly in the first part (subsections 1-3). The author is invited to quote from more recent works.

Equations (3, 4) and (5, 6) seem trivial: they both have the same expression. The author has to provide more convincing explanations.

The manuscript should also end with a lucid conclusion, highlighting the main results.
