Melanoma Theraccine

National Cancer Institute

Source

National Cancer Institute. *Melanoma Theraccine*. NCI Thesaurus. Code C1830.

A synthetic allogeneic cancer vaccine. Melanoma theraccine typically consists of lysed melanoma cells obtained from several melanoma cell lines combined with an adjuvant (such as DETOX or RIBI). This agent may be combined with immunomodulatory cytokines such as interferon alpha. Melanoma theraccine may induce a rise in the level of cytotoxic T-lymphocyte precursors. (NCI04)
