In the review article entitled "**Green Strategies for the Synthesis of Quinolone Derivatives**", authors have described the synthetic strategies for the green synthesis of quinolone derivatives. In my opinion, after the incorporation of the following comments, the manuscript would be ready for publication in a reputed journal.

1. Why did the authors choose quinolone for the review?
2. There are some typographical and grammatical errors. Please check them carefully.
3. All the structures (schemes) are not properly drawn (somewhere stretched). Please draw them again properly in view of uniformity (bond length, font, size, etc.). Authors can use ACS style in ChemDraw.
4. There are many more strategies reported for the green synthesis. Authors can also add those articles as references.
5. Conclusion must be written again in a more clear form.
6. More latest references should be given.
