

Review of: "From General Equilibrium to Algorithmic Equilibrium"

Tugrul Temel

Potential competing interests: No potential competing interests to declare.

This short article is full of ambitious and unclear (to me) arguments. This may partly be due to the fact that many pages of ideas previously developed by the author were put in a highly compact note, and hence, useful details are lost, making the understanding of the arguments difficult, if not impossible.

My only comment is that readers of this article and the like will benefit from a few examples of algorithmic equilibria advocated here. I am an economist and, like many other economists, I will be interested in simple examples of algorithmic equilibria so that one can see where and how adopting an algorithmic equilibrium approach will improve upon the neoclassical general equilibrium approach.

Thanks.
