Mental Health Challenges Among Children and Adolescents Associated With HIV Status Disclosure: A Systematic Review and Meta-Analysis Protocol

1. **Methodology:** The diagram depicting the stages of the study lacks information about the number of articles reviewed at each stage. Including this data would provide transparency and clarity regarding the research process.
2. **Analysis and Results:** The analysis and results sections are deemed to be very general and nonspecific. This suggests that the findings may lack depth or specificity, which could impact the article's overall contribution to the field.

Given the importance of the subject matter, it's crucial for the article to provide a robust methodology and detailed analysis to effectively address mental health challenges among children and adolescents associated with HIV status disclosure.

Providing specific data and insights can enhance the article's credibility and impact.

Good Luck
