## For Editor:

The aim of this manuscript is based on Kc calculation in different crops under field experimental conditions. In fact, it could be valuable research for his region. However, as the authors noted in the manuscript, there were significant ambiguities or omissions. Kc values were above 2. It is unusual compared to the the known values or FAO-56 approach. In this case, the measurements in the field plots may have been either incomplete or not sufficient and accurate. As a result, the authors need to make corrections according to scientific and perhaps criticism given on the manuscript , and also revise the grammar in terms of English language. The other critical reviews can be seen on the manuscript attached into the website of the journal
