It is important for the authors to acknowledge any limitations inherent in their study. For instance, the use of aggregated data and the focus on a specific country may limit the generalizability of the findings. Additionally, it would be useful to suggest avenues for future research, such as investigating the effectiveness of specific interventions targeting obesity and exploring the causal relationships in different socio-economic contexts.

Overall, the study provides valuable insights into the causal relationship between NCDs, obesity, and health expenditure in Turkey. The use of robust econometric techniques and reputable data sources strengthens the reliability of the findings. To enhance the article, it would be helpful to address the aforementioned points, including discussing policy implications and limitations, as well as providing more details on the methodology.

It is a manuscript with a high scientific contribution and suitable for publication.
