Potential competing interests: No potential competing interests to declare.

These are any suggestions that I can give to improve this article:

1. Could we categorize technicians as health care workers?
2. In study tool section, it supposed to be demographic profile of respondents, not demographic profile of study population. Even though sample of the study are all of the staff in study location.
3. It will better if there is an explanation about the most frequently knowledge questions answered incorrectly by respondents. So, recommendations from research results can be more targeted. The researcher can divide the answer according to the group staff.
4. It will better if there is an explanation of the questions related to what most respondents answered incorrectly about the knowledge. So, recommendations from research results can be more targeted. The researcher can divide the answer according to the group staff.
5. It should be any narration to define every table in the manuscript.
6. Reference addition is necessary.

Thank you for giving me the opportunity to do this task. Best regards.
