Potential competing interests: No potential competing interests to declare.

The examined paper provides a critical analysis, predominantly residing within the realm of theory rather than delving into practical exemplifications. To augment its profundity, the incorporation of empirical substantiation, encompassing data, statistics, and cartographic representations, is suggested to expound upon pivotal concepts. Furthermore, an exploration of the ramifications of corporate entities within the study locale on both the local economy and ecosystems would significantly enhance the paper's substance.

While the paper adeptly probes the dynamics between capital-intensive landholders and socioeconomically disadvantaged groups, a more exhaustive discourse on how these dynamics intersect with the paradigm of sustainable development would introduce valuable nuance. Although the presented theoretical frameworks are indispensable, a judicious reduction in their density might enhance readability without compromising scholarly rigor.

A departure from a descriptive and impressionistic prose style towards a more analytical approach is recommended, particularly in the assessment of the ecological ramifications stemming from the influx of new enterprises in rural settings. A thorough comparative analysis between traditional small-scale agrarian practices, emphasizing self-sufficiency, and contemporary market-oriented agriculture would significantly contribute to the paper's depth and contemporaneity. Integration of cartographic representations delineating specific study fields and their geographical localization is imperative for the comprehensive and global relevance of the paper.

On an editorial note, it is advisable to eschew first-person references, opting instead for a formal tone throughout the manuscript. These editorial refinements are poised to elevate the overall quality of the paper.
