Potential competing interests: No potential competing interests to declare.

The article is interesting and could have a good impact, however the results presented by the authors are still very premature.

In the case of molecular docking they would have to indicate distances of the atoms of the Spike protein with the alpha synuclein. To find the docking site and, if possible, to carry out molecular dynamical studies.

In the case of experiments with alpha synuclein, constructions of synuclein and spike could be made to make co-transfections and determine if there is molecular interaction between both molecules.
