

Review of: "Prevalence of Buruli Ulcer Among Residents in Jasikan Municipality: A Cross-Sectional Study"

Babita Sharma

Potential competing interests: No potential competing interests to declare.

Thank you to the team for the approach in letting review this paper.

The authors work is well appreciated. The study is simple, yet of great importance to the locals, especially Jasikan Municipality. Based on my understanding, I have minimal queries that needs an explanation.

1. **Sample Size Determination**

A sample size of 56 respondents was sampled from the study population. The sample size was determined using the method described by Kelsey et al. (1996).

I would request the author to elaborate in the same sentence regarding, why "56" was taken. It is confusing and effortful to go and check the reference every single time.

2. **Strengths and Limitations**

"The use of a quantitative approach could help in the possible generation of a hypothesis for a more detailed study with a larger number of study participants in the study setting."

Please justify the above statement from the "strength and limitations" section. As per my knowledge, qualitative study is used to formulate a hypothesis.

I would request the author, if I can have the access to the questionnaire used in this study.

My general suggestion and advice to the author is to support similar kind of studies with larger sample size, in collaboration with local governing bodies.

Best wishes for the meaningful work done towards the society.
