Immunotactoid Glomerulopathy

National Cancer Institute

Source

National Cancer Institute. *Immunotactoid Glomerulopathy*. NCI Thesaurus. Code C158968.

Glomerulonephritis characterized by the presence of Congo-red negative microfibrils in the mesangium and capillary walls of the glomeruli. Morphologic findings include formation of microtubules, evident on electron microscopy, that are larger than those seen in fibrillary glomerulonephritis (30-50 versus 16-24 nm in diameter). There may be some overlap in the size of fibrils found in both conditions.
