Potential competing interests: No potential competing interests to declare.

This paper discusses an important concern on biodiversity conservation. It explores the relationships among different variables: wildlife product consumption (WPC), connection to nature (CTN), and perception of biodiversity (POB). It reveals that persons high levels of CTN and positive POB still have high likelihood to WPC. The paper provides several policy inputs relevant to the protection, management, and conservation of wildlife in Vietnam.

I recommend the following:

- Expound how the snowball sampling strategy was employed.
- Discuss the strategies in disseminating the Google Form, or in recruiting respondents to the survey.
- Include in the limitations of the study that only respondents with access to online platforms (i.e., google form) are reached.
- Provide information about the validation of the survey instrument used.
- Attachment of the survey instrument utilized in the study.
