MSMILE Regimen

National Cancer Institute

Source

National Cancer Institute. *mSMILE Regimen*. NCI Thesaurus. Code C158387.

A modified version of the SMILE regimen consisting of dexamethasone, methotrexate, ifosfamide, pegaspargase and etoposide that can be used in the treatment of natural killer (NK)/T-cell lymphoma. Compared to SMILE, in mSMILE the pegylated L-asparaginase is substituted for L-asparaginase and the regimen cycle length is shortened.
