Congratulations to the authors for combining the Phillips and Beveridge curve models with the objective of explaining the inflation rate. However, I would like the discussion section in Table 1 to contain more information (values of (V/U) , v_1 , v_2 , v_3) for the respective countries to observe the distances between them.

Note: In the statistical appendix, I could see the detailed results of the regression model.

Because the article is interesting, I suggest it be published.
