**Potential competing interests:** The author(s) declared that no potential competing interests exist.

This article is about anosmia associated with COVID-19 and present a short review of the literature and a case study. In the case study the authors report successful persistent anosmia and dysgeusia resolution due to Long-COVID after stellate ganglion block.

The title and abstract is appropriate. The case study is well described. It would be worth to add when the patient had Covid-19 or to write the type of the virus, and also the clinic where treatment was assessed. You also need to specify if you had an ethical approval for this publication and the patients' informed consent.

The discussion describes and discusses the issue very well, in particularly potential pathophysiological mechanism. You could add some more on the most recent analysis on smell loss and Covid-19 in bigger patients' studies this would give even better insight into the field. I suggest minor revision.
