Laryngeal Verrucous Carcinoma

National Cancer Institute

Source

National Cancer Institute. *Laryngeal Verrucous Carcinoma*. NCI Thesaurus. Code C8188.

A well differentiated, non-metastasizing squamous cell carcinoma arising from the larynx. It is an exophytic, warty, and slow growing tumor affecting predominantly older men. It is associated with tobacco smoking. Symptoms include hoarseness, airway obstruction, weight loss, dysphagia, and throat pain. If left untreated, it may cause extensive local destruction.
