Original paper highlighting the role and impact can play in the control of vector-borne diseases, particularly for mosquitoes in Indonesia. In this paper, the author emphasizes the fact that One Health, in addition to animal, human, and environmental health, should be extended to communities and decision-makers to have an impact. The way that the paper has been structured shows the added value of the One Health triad in bringing about community-engaged and owned interventions and influencing policymakers. To achieve this target goal, requirements are also presented in the article.
