The article tests a valid research question regarding side effects of covid-19 vaccination in Pakistan. The introduction and rationale seem apt. Methodology is robust and reproducible. However more information was available regarding sample selection procedure and including them in the study, it would improve the study. How were the participants from all over Pakistan approached and through which platform? How was the effect of vaccine side effects on daily routine gauged and categorized?

It would help if the conclusion was clearer and more succinct. At the moment its more of a recommendation than a conclusion.

Furthermore, causes of vaccine side effects can be discussed in the discussion section.

Overall, the study is good.
