Potential competing interests: No potential competing interests to declare.

The paper's analysis of the resilience concept and its application to urban real estate development is a remarkable quality. The author recognizes the significance of resilience in recovering from different crises, such as natural catastrophes, economic downturns, and disease outbreaks. The debate about the necessity to balance density and dispersion in urban development, as well as the realization of the possible benefits of a less dense built-up environment, is stimulating.

However, the work might be strengthened by including more concrete examples and actual facts to back up the claims made. While the author cites to a previous prediction research, detailed case studies or data to demonstrate the aforementioned principles and their consequences for real estate activities during the Covid-19 crisis would be valuable. Furthermore, the report discusses talks with experts and online sources but does not include particular references or citations, limiting readers' ability to study the sources in greater depth. Furthermore, there is no obvious and cohesive organization in the article. The author claims that the study is divided into four portions, although it is unclear where these sections begin and stop. A more detailed outline or subheadings might assist the reader in navigating the document and improving its overall clarity.

The paper's language and writing style are often plain and succinct. However, there are times when the usage of complicated language and jargon may make the text inaccessible to readers who are unfamiliar with the subject area. Finally, the conclusion section feels rushed and could need a more thorough overview of the important results and implications mentioned throughout the work. It would be beneficial to connect the ideas of resilience, real estate development, and the Covid-19 problem in order to have a better understanding of the future opportunities and possible obstacles in urban real estate resilience.

Overall, Tom Kauko's "On the Resilience of Urban Real Estate Development" is a stimulating examination of the resilience idea in the context of urban growth and its implications for real estate. The study has the potential to make a meaningful addition to the subject with further development, including the integration of specific instances, empirical evidence, and a clearer structure.
