Potential competing interests: No potential competing interests to declare.

I think I am not a part of the target audience for this piece, as I'm a cognitive psychologist and not conversant in the kinds of agents discussed within it. I think that is where the manuscript can be refined and strengthened – in tailoring it to a specific kind of reader or expert in a particular field. I did think that the author did a particularly good job selecting and accurately synthesizing relevant work in psychology (which is more difficult than it appears), and using it to motivate the rest of the piece. It's thought-provoking to consider how these kinds of agent-agent and agent-human interactions are going to drive important decisions in the future, and I appreciate the author's contribution.
