The paper "A Security Framework for the Mobile Application Using Color Barcode" presents a detailed analysis of a security framework based on color QR codes for mobile applications. However, there are several weak points in the paper that need to be addressed. Firstly, the paper lacks a clear and concise explanation of the methodology used in the research. The proposed methodology is not adequately described, making it difficult for readers to understand the approach taken in the study.

Additionally, the paper does not provide a thorough literature survey to support the research findings. It is essential to include a comprehensive review of existing literature and related work in the field to establish the significance of the research and its contribution to the existing body of knowledge.

Furthermore, the paper lacks a critical analysis of the results and findings. A thorough evaluation of the experimental results and their implications is crucial for validating the effectiveness of the proposed security framework. Without a robust analysis of the results, the paper's conclusions may lack credibility.

Finally, the quality of presentation and figures in the paper is subpar. The figures lack clarity and fail to effectively convey the information they are intended to represent. This impacts the overall understanding of the proposed methodology and the security analysis presented in the paper. Improved visual aids and clearer figures are essential to enhance the comprehensibility of the content.
