Potential competing interests: No potential competing interests to declare.

The article focused on the importance of monitoring the safety of urinary and venous catheters, in order to limit their use, and assure the early identification of adverse events such as phlebitis.

This perspective article provides insights on how side effects of urinary catheter insertion are underestimated, and why we should share more attention to this problem.

I would complement with the authors. I just would like to express some suggestions.

I would recommend to give a little bit more space to the background and a more general view on how the adverse events of urinary and venous catheters are managed.

I would also suggest to express a little better the actual perspective of the authors and to deep on possible future actions to tackle those risks.

I would finally recommend to summarize at the end of the article the main opinion on the subject.
