I have read the short QEIOS review by Han and Gasanoff with great interest. This is a timely and well written review which calls the attention to the importance of non-bilayer lipid phases in association with different biological membranes, most particularly energy converting membranes. The authors pay special attention to mitochondrial membranes – with a sight on possible pharmaceutical applications.

I suggest the following minor corrections: define the abbreviation 'IMM', use upper index of '-' in 10^2 10^{-4} , 2,84: use decimal point instead of comma
