The article is interesting as a first approach to the phenomenon of adjustment of non-native pronunciation to native pronunciation, taking into consideration the english phoneme TH. However, the sample size is very small and it may constitute just a case study. The author should properly justify the selection of the topic (previous observations of similar cases or studies that demonstrate the existence of this particular problem). Additionally, the spectrograms should be elaborated with more care, always maintaining a higher Hz range for women (5500 Hz) than for men (5000 Hz).
