This is a very sound paper. However it should be only the start of a wider examination.

It's weakness is in the way those learners of high and low satisfaction were separated. This could have been done not in response to a single question but statistically looking at the scores and deciding to look at those who were one standard deviation from the mean. Never the less there is some useful information here. There may be other questions to ask looking at the difference in satisfaction between men and women learners if there was any and the role of teacher encouragement in satisfactory levels.

Good luck in your future studies
