Potential competing interests: No potential competing interests to declare.

The article covers a topic related to cadmium toxicity-induced changes in antioxidative enzymes in animals, which is a current topic. Antioxidants are important parameters that are measured even in blood and tissue. Some suggestions have been added to the text to make it easier to follow while writing the article. I believe that the article is suitable for publication after the necessary revision.

Initially, there is a mess about abbreviations in the text, and also in the tables and figures' captions. The author should write all parameters and their abbreviations similarly (for example, catalase (CAT)).

Please add Figure 3 to the text.

The "significant dots" should be added to Table 1.

There is a mess in the discussion part. I think the discussion part should be reorganized to output the results of the study more clearly.

Sincerely yours,

Dr. Nilay Seyidoglu
