Potential competing interests: No potential competing interests to declare.

The article assesses 'Biliary Complications Following Liver Transplantation.' The study employs patient records from liver transplantation to determine the incidence and risk factors for biliary complications.

Strengths

- The research problem is well-defined, focusing on the absence of studies related to this topic in Tunisia despite the presence of liver transplantation procedures.
- Clear research objectives focus on incidence and risk factors.
- Long period for sample collection: 1999-2020

Weaknesses and areas of improvement

- Absence of ethical consideration part. The authors did not discuss the institute's approval. Approval is needed even if the study is retrospective.
- Introduction-relevant facts need to be cited.
- The presence of abbreviations without identification.
- The discussion section needs to interpret the study's results more effectively. It needs depth in analysis.
- The article needs proofreading and grammar correction.

Conclusion

While the study offers valuable insights into the biliary complications following liver transplantation, addressing the identified weaknesses would strengthen the overall impact of the research.
