Potential competing interests: No potential competing interests to declare.

In its current state, the paper is not in a position to be published.

The paper needs a major revision to make it credible to the scientific community.

Abstract

The abstract of this paper does not clearly reflect its content; please rewrite the abstract.

However, it may be beneficial to include a sentence summarizing the key findings.

Consider dividing the manuscript into sections such as introduction, study area, materials and methods, results and discussion, and conclusion. This will increase the overall structure and readability.

Key Words

The Key Words section is missing; please add five to six key words.

Introduction

The introduction is not informative enough; it could be improved in view of brevity. Focus on briefly presenting the background, objectives, and significance of the study.

The need and novelty of the article should be presented in the introduction. In terms of references, the author should present more recent research findings.

Study Area

Provide a more detailed description of the geological context and the significance of the study region. Include any unique features or geological history that make this area particularly interesting. Also, need a good and clear geological map for the study area.

A literature review does not provide good context, so it could be structured in a more integrated manner. Group related studies together and discuss more systematically their relevance to your research and the need for further citation.

Clearly outline the procedures and steps followed in each procedure, ensuring that other researchers can replicate the study. It includes details of data collection, instruments used, and data interpretation techniques.

Results

There is no mention of the results. The results would actually be the novelty of the paper. You have done a review study but not a summary of the results. Therefore, you should present the results of your study. Please provide a results section for readers. Additionally, add a section titled "Methodology" before the results.

Discussion

The discussion could be more in-depth, addressing the implications of the findings.

Conclusion

The concluding section summarizes the key findings and their implications for a broader geological understanding of the study area. State any limitations and suggest directions for future research.

Reference

Check the style of references for consistency. Make sure all references are properly cited in the text. Add latest references and focus on scientific writing.

Figures

Figures are not acceptable. Improve figures with references.
