The case study presented here by Professor Forsdyke is really interesting to read and written in a very personal and engaging way. As a sufferer of cardiac side effects after COVID-19 vaccinations with the Pfizer and later Moderna vaccines, there were clearly measurable (blood pressure) cardiac changes. Even though the risk of cardiac changes after COVID-19 vaccinations is already known, it is very exciting to read the view of an affected colleague from the scientific community. I therefore thank Professor Forsdyke for writing down his story. It would certainly be interesting to measure the cardiac function of affected patients even more precisely and perhaps even to characterise it more biochemically, but that should be the aim of follow-up studies. Apart from a few minor spelling mistakes, there is nothing wrong with the presentation and style of the article.
