The article mostly seems like a descriptive type presentation with some review of literature. Though it summarizes some valuable information on the reproductive behaviour of these two plant species, it lacks the sufficient documentary evidence provided through a statistically analyzed table of data, as mentioned, that have been recorded during the study. There is scope to improve the language and the presentation through proper delineation of the research problems it intends to address through this study. The results part needs to be improved by incorporation of a table based on field-collected data and discussion with the available literature.
