The structure of the article is relatively good, but it is suggested to pay more attention to the proposed algorithm and its findings. Especially regarding the abstract, which is not so well described regarding the proposed approach and the obtained results (in numeric form). In general, the proposed method and innovations seem more than the introduction and statistical content of the article.

In the writing of the introduction section, some additional material appears. For example, Figure 2, which shows the structure of the virus, has nothing to do with the problem of the article. Very good figures and charts are provided regarding the statistics and results of the work evaluation. But in some cases, sufficient explanation about the figures is not given in the text. Figure 6 is also not of good quality.

Regarding the dataset and the work done on it, it would have been better to give an explanation. In the comparison results section, a comparison was made with those works or similar works on similar datasets. It is also recommended that even if you do not explain the features of the dataset, you should at least mention their names in the text of the article.
