Potential competing interests: No potential competing interests to declare.

This article [Knowledge of Risk Associated with Exposure to Per- and Polyfluoroalkyl Substances in Abuja, Nigeri](#) presents the awareness of Abuja and Nigerian people of PFAS, and such importance is supported by a general introduction to the potential damages that PFAS can cause.

For the strength of the article, the logic matches well with their recommendations, as the awareness insufficiency was properly addressed, and the PFAS hazard was introduced. The data presented in the article was also organized thoroughly in the charts.

For the weaknesses, the objective of this article could be considered trivial since the authors are mainly urging other researchers to cast attention on the problem they addressed. The only original data in this article was solely the questionnaires, which potentially compromised the essence of this article as a survey instead of research. It could be useful if the authors performed further literature studies and offered more potential solutions in the awareness scenario, so that the conclusion could be much more than a recommendation.
