Potential competing interests: No potential competing interests to declare.

This article emphasizes the relationship between the quality of higher education and the social and economic advancement of a state, outlining some important ideas and suggestions for reforming higher education in Tamil Nadu. When This article acknowledges the value of higher education in India, a nation that is rising quickly, and the necessity for the government to set sensible policy guidelines in this regard. In order to take into account global aspirations when implementing higher education reforms in Tamil Nadu, this article recommends that India should learn from global reforms and best practices in higher education. This illustrates how crucial it is to match educational opportunities and trends with global developments. Aside from that, the paper emphasizes the value of research and innovation in higher education. It is interdisciplinary, multidisciplinary, and transdisciplinary, and it uses these approaches to solve complicated problems by combining information from many scientific areas. The article also suggests modifying curricula to better suit the needs of individual students and generate graduates who are more equipped for the workforce. Examples of such modifications include implementing mentor-mentee relationships and personalized learning to improve students' educational experiences as well as Universal Human Values-Based Learning. From what I understand, there are several notes that I underline, including:

There isn't currently a strong paper framework with primary content like figures and tables for every IMRAD component, despite the fact that textual explanations that adhere to the formal language style of international article standards already exist.

The abstract should be rewritten by the authors because it is less enticing. Additionally, a clear summary of the aim, methodology, results, analysis, and implications should all be included in the abstract. I believe the author could make this abstract clearer by taking into account the discussion and conclusion that are also given.

The author has to clearly explain the paper's perception and idea reconstruction in its initial section. The author must also clearly state the goals and questions of the research in order to persuade the reader that the topic under discussion is pertinent. It's crucial to establish the context and draw attention to the research gaps that require attention. This paper doesn't provide an ideal explanation, in my opinion.

I haven't seen the writers of this manuscript, if it employs qualitative methodologies, analyzing the data using a grounded theory, thematic, or narrative analytic approach. Internal validity is one of them (reliable data and consistent analysis). to enable a clear interpretation of the results in light of the author's conceptual framework and the surrounding context.

Few references are mentioned, particularly those from more recent, respectable publications in the same field. To strengthen the framework, it would be preferable if the author expanded by including the most recent references from reputable journals.
