# Fenquizone

National Cancer Institute

## Source

National Cancer Institute. *Fenquizone*. NCI Thesaurus. Code C65670.

A quinazolinone sulphonamide-based diuretic, structurally related to metolazone, with thiazide-like activity. As a thiazide-like diuretic, fenquizone acts by blocking reabsorption of sodium in the proximal tubule and the ascending branch of the loop of Henle. This causes an increase in diuresis with the elimination of chloride and sodium.
