The article is thoroughly detailed. I appreciate the attention given to correcting the linguistic errors and taking into account the provided remarks. I hereby approve the publication of the article.

1. The introductory background is adequate, and some critical pieces the study has projected. Concise remarks on coronaviruses should be exercised so that such coverage doesn't majorly overshoot the review's research goals.
2. Transitions between sections can still be improved. For example, the jump from SARS-CoV-2 origins to pet-related diseases feels abrupt. Adding a bridging statement would help.
3. Be certain with terms like COVID-19, SARS-CoV-2, and novel coronavirus. Terms should be used consistently and not switch the terms unnecessarily.
4. Thus, practical implications to be drawn from this situation for pet owners remain scattered and unclear. Suggested recommended guidelines represented in one cohesive picture for such pet owners may range from certain precautions, such as isolating infected pets, avoiding close contact with infected pets, etc.
