# Alvocidib Hydrochloride

National Cancer Institute

## Source

National Cancer Institute. *Alvocidib Hydrochloride*. NCI Thesaurus. Code C1571.

A synthetic N-methylpiperidinyl chlorophenyl flavone compound. As an inhibitor of cyclin-dependent kinase, alvocidib induces cell cycle arrest by preventing phosphorylation of cyclin-dependent kinases (CDKs) and by down-regulating cyclin D1 and D3 expression, resulting in G1 cell cycle arrest and apoptosis. This agent is also a competitive inhibitor of adenosine triphosphate activity.
