Review of: "Vicious cycles and questions without answers"

Vladimir Grushko

Potential competing interests: No potential competing interests to declare.

The author makes an attempt to understand a rather simple problem in a very confusing way. It is clear that a question posed incorrectly will not have an answer. The left side of the equation (question) should match the right side (answer). If the question is incorrect, mathematically this means that this equation has no solutions, no matter how persistently the agent insists on its existence, entering into a vicious circle with the possibility of reaching madness. The author does not make a clear conclusion about the solution of the psychological problem of stubbornly finding a solution to an equation that has no solution and suggests simply abandoning the solution, instead of giving advice to formulate the question correctly. Incorrect questions arise from the questioner's misunderstanding of his own nature or/and from his misunderstanding of the essence of the phenomenon about which he is asking. Letting go of the questions an agent asks himself does not, in and of itself, mean gaining wisdom. Wisdom is asking the correct questions.
