Reviewer Comment

Title: Hepatoprotective Effect of the Ursolic Acid-Oleanolic Acid Mixture Administered Intragastrically in Mice with Liver Damage Induced by Anti-TB Drugs

Comments

1. Title

- It has to convey what is indicated in the manuscript body.
- For example: nephroprotective??

• 2. Abstract

- I think it is better if it contains problem statement as introduction.
- On the methods part it is better if you highlight how, you proof your hypothesis.

• 3. Introduction

- Rather than using five references for one paragraph it is better if you select the most recent and representative for paragraph message.

• 4. Methods

- It is better if you incorporate:
- The number of mice utilized for the study.
- Temperature, relative humidity of the laboratory at which the animals were cared for during the study period.
- The chemical used for anesthesia and amount of blood collected
- Serum preparation for biochemical parameter analysis
- Histopathology procedure
- Percentage yield of the extract

• 5. Result

- Use arrow to indicate areas that contain findings.

• 6. Discussion

- Incorporate the justification of your findings with regard to other study.

• 8. Conclusion

- Better if you stick to your finding rather than making general conclusion.
- **9. General comment**
- If you amend all the above stated comments, I think your paper quality can become good.
