Potential competing interests: No potential competing interests to declare.

The contribution of the whole paper is not fair enough. The novelty and innovation need to be added. I recommend a major revision due to the following points:

1. Abstract: needs improvement;
2. How do the authors address the potential biases in training data that may impact the effectiveness of sentiment analysis and emotional color analysis in differentiating between propaganda and non-propaganda materials?
3. How do they propose to mitigate the limitations related to the dynamic nature of language and the evolving tactics used by propagandists to manipulate emotional connotations in deceptive narratives?
4. What are the potential challenges and limitations associated with the integration of sentiment analysis and emotional color analysis in detecting propaganda and fake news?
5. How might contextual nuances, language dynamics, and cultural references pose challenges for automated systems in accurately interpreting emotional connotations in textual content?
