

Review of: "On the existence of precession of planets' orbits in Newtonian gravity"

Breno Raphaldini

Potential competing interests: No potential competing interests to declare.

The present paper addresses the problem of whether the anomalous rate of precession of the planets can be explained using the framework of Newtonian mechanics. Going through the text I found that the problem is very clearly stated, the manuscript is well written and the derivations very easy to follow. Therefore, I have no objections to its publication. I have a small optional suggestion, if the author could include a schematic figure summarizing the findings, I think it would benefit the paper.
