Review of: "Exploring the Magnitude-Shape Plot Framework for Anomaly Detection in Crowded Video Scenes"

Michael George¹

1. Rajiv Gandhi Institute of Technology, Kottayam, Kottayam, India

The paper presents an interesting take on reconstruction error-based anomaly detection. But a better analysis of the method would give insights into its performance. For a start, the UCSD Ped1 dataset and the Subway dataset can be considered. Also, newer datasets in this domain are available, and more comprehensive analysis can be done using these. It also seems that no computational time details are presented; it seems to be computationally intensive, so real-time analysis might not be possible.
