

Review of: "Impact of risk factor diabetes mellitus on patients with periodontitis"

Mayank Kumar Parakh

Potential competing interests: The author(s) declared that no potential competing interests exist.

The literature to back is quite outdated such as article 20 which was published in 2000, such data to back the authors claim of lack of association between periodontitis and diabetes mellitus is extremely far fetched. The article however is well written. But, this topic has been extensively studied in literature and various relations have been established, the author here seems to be adding on additional parameters that might have acted as confounding variables in the relationship and is justifying their claim. In reality however, this is not true as there are various studies in literature which have shown that oral hygiene helps regulate blood sugar levels and HbA1C levels. Hence, the authors should read up and get better evidentiary support for their conclusions.
