Potential competing interests: No potential competing interests to declare.

The second version of the submitted paper included supplementary statistical analysis parts, which made this study richer. The author(s) included an ANOVA table as well as some more analyses like regression and mean comparison, which helped to identify the main effects of each factor in this research. I think it is worth being published. In the V2 version, the results and discussion parts are more detailed and accessible. The references were updated and well discussed in the main text.
